

CashEase Nigeria

Feasibility Study

Owned multi-service cash kiosks on everyday streets — petty traders, mallams, bus waits. Note-breaking, POS cash-out, airtime and bills. Pain follows people; availability is ATM-like. Destination: an inclusive, holistic stall platform (cash, restock, goods on credit, BNPL) for traders Omni-class apps skip. The company owns the machines; a bank supplies small notes and settlement. One machine per counted pitch. Raise ₦1.85 billion for 350 kiosks, then fund 2,000.

Prepared	August 2026 · v2.8
Horizon	6 years (2027–2032) · 350 → 2,000 → earned scale
Opening equity	₦1.85 billion for 350 kiosks (planning case)
Planning unit	180 tx/day · ₦100 blended fee · break-even 89 tx/day
First operating scale	Hold at 2,000 with an ₦8–12 billion facility (DSCR ~2×)
Classification	Planning document — not financial, legal, tax or investment advice

Independent Multi-Service Cash Kiosks

Note-breaking · POS cash-out · Airtime and bills

Nigeria — Lagos / Ogun first, then national hubs

CashEase deploys owned kiosks wherever ordinary people already spend cash in daily life — buying a drink from a petty trader, paying the mallam on the street, taking a bus or waiting for one. The need is universal; the product is availability, like ATMs. Each box breaks notes, pays out POS cash, and sells airtime and bills. Banks supply small notes and settlement. The company owns the machines. Scale follows a dense first belt of those everyday doors: 350, then 2,000, then national hubs.

Field	Detail
Working name	CashEase Nigeria Ltd (legal name to be confirmed)
Prepared	August 2026 · v2.8
Horizon	Year 1–Year 6 (2027–2032)
Currency	Nigerian naira (₦), nominal
Planning case	180 tx/day, 92% uptime, ₦100 blended fee, bank cash from Year 2
Classification	Confidential planning document

Purpose. This study sets out the operating plan, market, sites, technology, bank and regulatory path, six-year financials, funding, cost-benefit, risk, and the capital to commit now.

Disclaimer. Figures are illustrative projections on stated assumptions. They are not guarantees.

Independent professional advice is required before capital is committed. This document is not financial, legal, tax or investment advice.

1. The Plan

Nigeria's last mile still runs on cash. The customer is **everyone who spends notes in daily life** — including the poor, who are more cash-dependent, not less. Pain follows people, not a shortlist of famous crowd places. A drink from a petty trader, change from the mallam, a bus fare, waiting for that bus: those

are the jobs. Population is the strength of the market. Dedicated change kiosks are a **new category**, so there is little historical “tx per kiosk” data; that is unmeasured, not disproven. CashEase is **ATM-like convenience for that everyday need** — available where people already are, so they do not hunt. For the stall, the mallam, the conductor, that convenience is also a **platform offer**: they lose fewer sales, then restock, then take goods on credit / BNPL once they are known. Phase 1 is how that habit is **proven by covering a first belt densely enough that money can follow availability**.

The business, in one page

1. **Own 100% of the kiosks.** They are company assets and later collateral.
2. **Sell a bundle, then a stall OS.** Note-breaking is the reason to stop; POS, airtime and bills pay the rent. The destination is an **inclusive, holistic trade platform** (cash → restock → goods on credit / BNPL) for stalls Omni-class apps skip. Only after we know them.
3. **Follow people on everyday streets.** Petty-trade rows, mallam spots, bus waits and park edges — not only named mega-nodes. One machine per counted pad. Dense coverage in a belt, like ATMs, so the habit forms.
4. **Rent space like any shop.** Ordinary leases. Hosts get rent and maybe 5–10% of that site’s net.
5. **Partner with a bank for cash**, after live volumes: they load small notes and settle POS; they take a share of eligible fees; they do not buy the hardware.
6. **Build 350, then 2,000.** That grid is the demand file for a new market. National hubs follow when those doors hold traffic.
7. **Use policy as support.** Alignment with cash circulation and inclusion helps a bank or BOI conversation. It is not the commercial contract.

Opening numbers — planning case

Metric	Value
First commitment	350 kiosks
Opening equity	₦1.85 billion (₦1.35bn machines + ₦420m float + ₦80m HQ/licences)
Unit CapEx	₦3.50m hardware/software + ₦0.35m fit-out = ₦3.85m
Phase 1 float	₦1.20m per kiosk (self-funded; bank takes most of this from Year 2)
Traffic assumption	180 transactions/day · 92% uptime · ₦100 blended fee
Gross per kiosk / month	₦504,000
EBITDA break-even	89 tx/day (51% margin of safety vs 180)
Phase 1 as a six-year hold	IRR 11% · NPV at 22% –₦448m (proof engine, not the wealth case)
Hold at 2,000	IRR 21% · ~ ₦1.2bn NPAT/year · NPV at 22% –₦89m unlevered
₦8bn facility on a 2,000 hold	Equity NPV +₦2.50bn · min DSCR 1.96x
Held 2,000 run-rate	~ ₦12bn gross / ~ ₦1.2bn NPAT
20,000 good doors, Year 6	~ ₦106bn gross / ~ ₦10bn NPAT — an earned option

Figure: Capital committed now is Phase 1. 2,000 is the first operating scale. 5,000 and 20,000 follow gates, not a single purchase order.

Feasibility

Question	Plan
Is the model sound?	Yes. Owned multi-service kiosks on cash paths, bank-supplied float.
Phase 1 (350, ₦1.85bn)	Go. First grid for a new mass-cash category: sites, OEM, and books.
2,000 kiosks	Go after Phase 1 gates, with an ₦8-12bn facility and a bank cash SLA.
20,000 kiosks	Later option if unit traffic still holds in new hubs.
₦90bn annual profit or one ₦90bn loan	Outside this model. Thin fees and one queue per pad cap earnings.
₦90bn+ annual revenue	Possible at ~20,000 doors that still do ~180 tx/day.
Empty pads (no daily cash moments)	Move the box. Follow people; do not leave iron where nobody already stops.

Capital this year: raise and deploy **₦1.85 billion** into 350 counted kiosks. Order 10 OEM units first. Sign a bank when those kiosks have months of data. File for **₦8-12 billion** toward 2,000 only then.

2. Business Model

2.1 Concept

Each CashEase kiosk is an unmanned (or lightly attended) multi-service stop:

- accepts large Naira notes and dispenses smaller notes (coins only if stock exists);
- offers POS cash withdrawal;
- sells airtime, data and bill payment;
- later, screen advertising and, with the right licence, adjacent services.

The public customer is the cash-using worker: conductor, trader, artisan, commuter. The institutional customer is the **partner bank**, which wants float turn, non-branch reach, and help with agent/ATM density — without buying or maintaining the box.

2.2 Who owns what

Aspect	Owner
Kiosk hardware	CashEase — 100%
Site lease and brand	CashEase (optional co-brand with the bank)
Cash inside the cassettes	Partner bank, once the agreement is live
Settlement	Bank / NIBSS
Change fees	CashEase (minus any host share)
POS / acquiring fees	Target 60-75% CashEase / 25-40% bank
Relocation	CashEase after notice

Owning the estate keeps the fee stream, the collateral, and the right to move a dead site. The bank's role is **float and settlement**, which is what makes small notes solvable at 2,000 units (₦2.4bn of cash in the field at ₦1.2m per box).

2.3 Why the bundle

Note-breaking is why a conductor stops. A change-only fee (₦20–₦100) does not cover rent, CIT, insurance and depreciation unless traffic is extreme. POS cash-out and bills are already how Nigerian agent kiosks earn. CashEase adds a change cassette to that proven stop.

Planning mix: about **45% note-breaking / 40% POS / 15% airtime, bills, ads**.

2.4 What this plan is not

These are outside the operating design (they may appear later as options):

- selling machines to banks or the CBN;
- living on ATM-vestibule commission as the core estate;
- kiosk franchise to fund the first 2,000;
- a government endorsement as the commercial deal;
- four machines on one pad as the national template.

2.5 Value by party

Party	Why they participate
Public	Faster, safer small notes and cash-out on a trip they already make — drink, mallam, bus
Petty trader / mallam / conductor	Keep sales that now walk; later restock and float so the existing business can grow
Site host	Rent ± a small share; less “no change” friction for their own customers
Partner bank	Volume, float, non-branch footprint, MSME growth story on a live grid
CashEase	Daily fees, owned assets, a network that can be financed; later a slice of trader GMV

2.6 Value proposition — help existing businesses grow

The second pain, after “I cannot break this note,” is **the stall cannot grow**. Stockouts, walked customers, a morning spent at the market instead of selling, no small notes in the till, no one who will restock a crate they already know how to sell — those cap turnover. Helping that business grow is a value proposition, not a CSR line.

How growth is delivered (in order)

Step	What the trader feels	What CashEase ships	When
1. Stop leakage	The ₦1,000 customer does not walk	Change + cash-out on the same street	Phase 1 — the kiosk
2. Stay in stock	The crate is full without the trek	Thin restock: small MOQ, drop to known stalls	After 30–50 live doors; not a second company in Month 0
3. Grow the crate	More turns, larger order, pay later	Credit / BNPL only on stalls already seen buying and selling	After books; bank or distributor floats goods

Growth means **more sales for people who already trade**. It does not mean minting new traders on day-one credit. Ease and convenience lower the **restock** barrier. They do not lower the barrier to enter trading with someone else's inventory.

The growth layer is a platform of services — goods on credit and BNPL — not a consultancy.

“Bring each business up” means the stall can take more stock **before** they have the cash, on terms, because you already see them sell. That is a **trade-services platform** sitting on the same streets as the kiosk: restock + goods-on-credit + BNPL (+ later pay-in, collections). One system, many stalls. TradeDepot, Sabi, OmniRetail and Moniepoint already sell this shape. CashEase's wedge is the **live cash door** and the named trader on that door — underwriting from behaviour on your pad, not a credit-officer tour.

Service	What the trader gets	Who holds the risk	When
Restock (cash)	Goods to the stall, small MOQ	Trader pays on drop	After 30–50 live doors
Goods on credit	Take the crate now, pay from sales	Bank / distributor / licensed lender — not CashEase's ₦1.85bn	After weeks of seen restock and repayment
BNPL on the same order	Scheduled pay-down tied to that invoice	Same — CashEase originates and collects; a partner books the receivable	After books; CBN digital-lending rules apply
Kiosk (Phase 1)	Change and cash-out so today's sales do not walk	Cassette is bank float	Now

CashEase **originates and collects**. A licensed partner **books the loan**. Day-one BNPL to strangers is how the book dies. BNPL to a mallam you have restocked and seen repay is how the platform takes a slice of GMV — the path that can compound past kiosk fees.

This is not assigning a manager to every stall. Humans on the street drop and collect. The product that “manages” growth is **credit attached to goods**.

2.6.1 Beat OmniRetail: inclusive + the whole stall process

The category leader to watch is **OmniRetail** (and TradeDepot / Sabi): factory → distributor → shop, 160k+ retailers, credit, OmniPay. That is a real, capitalised **route-to-market** machine. CashEase does not beat them by cloning OmniOne for manufacturers in Year 1.

Where they are strong. Brands and distributors: visibility, warehouses, SKU range, collateral-free credit for shops already on the app, POS for collections. Their customer at the top of the file is the **manufacturer**. The retailer they want can order, take delivery, and sit in a credit model.

Where they leave a gap — inclusive. A large layer of last-mile trade never clears their floor: the mallam, the drink crate, the park-edge seller, the person who is cash-only, has no smartphone habit, cannot meet MOQ, and is not a “retailer” in a brand's dashboard. **Inclusive** here means: start those

businesses anyway — cash-first, small packs, the kiosk on the street, no app required to take the first sale.

Where they leave a gap — holistic. Omni's process is **supply**. The stall's process is the whole day:

Stall process	Omni-class today	CashEase
Customer pays with a large note	Weak / not the product	Kiosk — this is the wedge
Stay in small notes / cash-out	Agent POS, not change	Hopper + POS on the same pad
Restock	Their core	Later, smaller MOQ, named stalls
Goods on credit / BNPL	Their core	Later, partner-booked, on your door
Airtime, bills, walk-up cash	Separate fintechs	Already on the box
Brand / factory dashboard	Their core	Out of scope until a working belt

Holistic means one relationship for that loop — take money, keep selling, restock, take goods on credit — not eight apps and a trek. It does not mean ship 900 SKUs and a manufacturer portal before the hopper works.

How you actually beat them. Go **lower** (people they do not onboard) and **wider on the stall's day** (cash + change, which they do not own). Do not fight them for Unilever's dashboard. If a stall later grows into Omni's band, you already have the cash door and the repayment file. Partner or coexist on big SKUs; own the last metre they skip.

That ladder is the path from thin kiosk fees to a **platform take on GMV**. Phase 1 still only meters the kiosk. Omni-class GMV is earned on the same streets after the door is real.

2.7 SWOT

	Helpful	Harmful
Internal	Clear ownership; bundle matches how people already use agents; China OEM path is real	Cash logistics; theft; float until a bank line exists
External	Population-scale daily cash need; pain follows people; ATM-like convenience; stalls Omni-class apps skip; holistic stall process	Device classification; small-note scarcity; POS aggregators and Omni / TradeDepot / Sabi already on reachable shops

3. Market

3.1 Demand thesis — people, everyday cash, a new category

The bet. Demand sits with **people**, not with named areas. Everyone — irrespective of class — has a daily need for small notes and cash-out: a drink from a petty trader, change at the mallam, a bus fare, waiting for that bus. Nigeria's population is the market's strength. Pain travels with those people. Poverty raises cash dependence; it does not remove the need to break a ₦1,000 for a ₦300 ride or a ₦200 purchase. A reliable place to get ₦100s and ₦200s is a mass convenience, like an ATM for that particular everyday job — not a gadget for one famous market. For the seller, the same convenience is how the **existing business grows**: the sale that used to walk, stays.

Why there is little kiosk data. A dedicated note-breaking kiosk is a **new category**. There is no 20-year series of "transactions per change machine." That gap is **unbuilt infrastructure**, not missing pain. The pain is already on the ground, in ordinary streets. Agency cash-out and ATMs showed that when availability matches a universal daily need, **money follows**. CashEase adds the cassette those streets still lack: small notes.

3.2 On-ground pains this business solves

These are the proof of **need**. They are visible every day without a kiosk P&L. Phase 1 measures **whether a box captures them as paid transactions** — it does not invent the pain.

Who	Pain on the ground	What the kiosk does
Anyone buying small	Drink from a petty trader, sachet, pepper — seller cannot break a large note; sale dies	Breaks the note beside the stall or on that street
Mallam / street seller	Holds stock, not a till of ₦100s; customers and the mallam both hunt change	Everyday availability on the same corner as the need
Bus / danfo / keke conductor	Passenger pays ₦500 or ₦1,000 for a ₦200–₦300 fare; no ₦100s; argument, delay, lost seat, or the conductor eats the difference	Breaks the note in seconds at the park edge or the wait
Person taking or waiting for a bus	Anticipating the trip with a large note; misses the bus or overpays while hunting change	Convenience on the wait — like finding an ATM for that job
Trader / stallholder	Cannot make a small sale because they cannot break a large note; customer walks	Dispenses ₦100s/₦200s next to the stall belt
Same stall, trying to grow	Empty crate, trek to wholesale, time off the street, no one will restock a known seller; turnover is capped	Stops leaked sales now; later small-MOQ restock and credit only after the stall is known
Artisan, hawker, daily-pay worker	Wages and purchases in mixed notes; spends the morning asking “do you have change?”	One stop on the walk they already make
Market / park as a system	Trade slows when small notes dry up; informal changers charge a harsh spread or disappear	Liquidity in use — ₦100s in the hand, not in a vault
POS cash-out user	Can withdraw but still cannot break for fare or pepper; the last-mile gap remains	Change cassette on the same pad as cash-out

The poor feel this **more**, not less: they live in cash, in small tickets, with no card to skip the problem. Population multiplies how often the pain happens. That **is** demand validation for the **job**. What no one has yet is a meter on a live CashEase door. That meter is the first 350 boxes on the same everyday streets.

3.3 Pain follows people — ATM-like availability

The product is **not** “put boxes at famous crowd places.” Famous names (a big market, a famous park) are only examples of **people already stopping**. The same pains happen on ordinary streets: the mallam with drinks, the petty trader, the bus stop where people wait and anticipate the trip. Those moments are daily. They are not a destination people travel to. They are life.

ATM logic. People do not go to one celebrated ATM plaza. They use the machine that is already on their walk — because cash is a daily need and availability became a habit. Banks did not win by listing twenty landmarks; they won by covering daily life until the network felt everywhere. CashEase is the same job for **small notes and last-mile cash**: once the box is in front of the trader, the mallam, and the bus wait, people use it because the need is already there. Money follows that convenience.

What “everywhere” means. Follow people, not a tourist map of hubs. A street with petty trade, a mallam, and buses is a CashEase street — whether or not it has a famous name. A pad with nobody already stopping for daily cash is like an ATM in an empty field: ATMs are not there either. The filter is **everyday activity**, not celebrity.

Why a first belt still densifies. ATMs also rolled out as **coverage in a city**, then copied. Phase 1 packs Lagos-Ogun everyday streets so the product feels as available as an ATM in that catchment — that is how habit (and therefore money) forms. Spraying one quiet box per LGA does not create ATM-like convenience. Saturating ordinary cash streets in one belt does.

Pillar	What we take as given	What Phase 1 writes down
Universal daily need	Everyone: drink, mallam, bus, stall — including the poor	Tx/day, fee mix, peak hours on each pad
Pain follows people	The need travels with the person, not the place-name	How many everyday streets in the belt clear 89–180 tx/day
New category	No incumbent “change kiosk” chain	First category dataset for banks and BOI
ATM-like convenience	People use what is in front of them for a daily job	Dense belt + stocked hopper → habit → money follows
Existing businesses grow	Stalls lose sales and cannot restock easily	Leakage down on live pads; restock/credit only after the door is known

Policy rhyme. Faster small-note circulation at the last mile is liquidity **in use**. Helping existing micro-businesses **grow turnover** (not mint new traders on credit) is a fair MSME / inclusion story. Both support introductions and file language. The commercial meter remains the books on those doors.

Nigeria remains cash-plus-digital. Large notes are easy to get; small notes are not. People do not travel across town to break ₦1,000. They need ₦100s **while they are already** buying, waiting, or boarding. CashEase intercepts that moment.

3.4 Where the money is

The comparable business is the POS/agent kiosk and the **ATM network** — ubiquitous tools for a daily cash job — not a shortlist of named mega-nodes.

Layer	Meaning
Primary (Phase 1)	Dense coverage of everyday cash streets in Lagos/Ogun: petty-trade rows, mallam spots, bus waits, park edges, busy petrol on those same walks
Secondary (Phase 2)	The same coverage pattern in Ibadan, then Abuja, Kano, Port Harcourt, Onitsha
Later	More hubs if Phase 2 unit economics hold

Site work starts with **people counts**, not landmark lists: how often in two weeks someone buys small, asks the mallam for change, waits for a bus, or walks from a stall for lack of ₦100s — then CBN denomination mix and acquirer cash-out in that catchment.

3.5 Pricing

Nigerians already pay ATM surcharges and agent fees. ₦20–₦100 to break a note and ₦50–₦200 for POS cash-out are in-market **if** the alternative is a hunt for ₦100s. Pricing dies if the cassette is empty, a human agent next door is cheaper, or the site is a mall with working ATMs.

3.6 Competition

Competitor	Implication
OmniRetail, TradeDepot, Sabi	Factory-to-shop platforms; credit and restock for reachable retailers. Do not clone their manufacturer portal. Beat them by inclusion (cash-first, smaller stalls) and a holistic stall process (change + cash, then restock/BNPL). Coexist on big SKUs
Moniepoint, OPay, PalmPay, bank agents	Sit in the same doors. Differentiate with the change module and owned hardware; partner for acquiring
Informal changers	Instant and flexible. Win on reliability, hours, and having stock
Bank ATMs	Dispense larger notes; poor small-note mix. Adjacent job, not the same pad

3.7 Regional expansion

Other African currencies are out of scope until Nigeria has a working 2,000.

4. Product, Technology & Supply

4.1 Minimum viable kiosk

Function	Requirement
Accept	₦200, ₦500, ₦1,000 (and ₦100 if supported) with UV/MG/IR checks
Dispense	₦50 / ₦100 / ₦200 / ₦500 cassettes; coin hopper optional — do not depend on coins
POS	Certified PED or Android POS via a licensed acquirer
Power	Solar + battery for 12–16 hour market days
Security	Safe, sensors, cameras, GPS, remote inhibit, limited cassette value
Software	Naira maps, remote cassette levels, lockout, reconciliation, bilingual UI
Uptime target	95% (planning models 92%)

Planning unit cost: **₦3.5 million** landed and configured, plus **₦0.35 million** site fit-out. Stress uses ₦4.5m + ₦0.45m. Upside uses ₦3.0m + ₦0.30m.

4.2 OEM

Chinese manufacturers already ship validators and kiosks into Africa. The work is Naira firmware SLAs, a Lagos spare pool, 12–16 weeks first-batch lead time, and FX (20–30% naira slide sits in stress CapEx).

Procurement gate: 5–10 prototypes → 30–50 pilot → balance of the 350. No 2,000-unit purchase order before Phase 1 data and a bank cash line.

4.3 Software

Custom software runs denominations, telemetry and reconciliation. Licensing that stack to others is a Year 4 option after 2,000 machines have clean logs. It is not a second company in Phase 1.

5. Locations, Cash & Operations

5.1 Follow people, not place-names

Planning assumes **180 paid transactions per up day**. A pad with no everyday cash moments will not print. That is a **people** result, not a verdict on a famous area.

The site is the daily activity, not the landmark. Mile 12-class markets are busy because people already stop there to trade. The same job exists on unnamed streets: petty traders, the mallam, the bus wait. Those streets are the estate. Named hubs are optional density, not the strategy.

Phase 1 site types (everyday cash moments)

- Petty-trade rows and street sellers (drinks, food, small goods)
- Mallam / corner spots on walking streets
- Bus, danfo, keke waits — people anticipating the trip, not only the “famous park”
- Park edges and last-mile junctions — conductors and passengers
- Busy fuel stations on those same walks

- Campus gates and hospital approaches only if weekday people-counts support them

How a site is taken

1. Count three day-parts for two weeks. Record petty buys, mallam change-asks, bus waits, existing POS/ATM, and “do you have ₦100s?” events.
2. Written lease: ₦50k–₦200k/month plus optional 5–10% of site-attributable net; short performance guarantee for the host if useful.
3. Street / market association / park leadership; LGA; budget “area” cost honestly.
4. Fix the POS geotag.
5. 12–36 month occupancy with relocation rights.

Budget **₦100k–₦300k** per pad for deposit and extra fit-out. Do not open the 50th site until the first 10 have four weeks of data.

You rent like any shop. You do not need a bank vestibule or a government plot. You also do not spray boxes onto empty plots: ATMs follow people. CashEase does the same. The majority need change; they use whatever is **already on their walk**. Dense coverage of those walks in one belt is how availability starts to feel like ATMs — and how money follows.

Figure: After logistics, rent, bank share and field cost, there is no 50% net margin. Throughput has to be real.

5.2 One queue, many ordinary doors

The plan is **many machines on everyday streets in one corridor**, each on its **own** pitch — not one machine for all of Lagos, and not four machines on one slab. Famous names are not required.

Setup	In the plan?
Dozens of boxes on petty-trade streets, mallam corners, bus waits, park edges, petrol on the same walks	Yes — Phase 1-2
Two boxes at opposite ends of a huge market or long street	Often yes
Second box on the same pad after ~250+ tx/day and real queues	Yes, earned
Four side by side at one station, hotel or mall door	No as default

A 180 tx/day door with four machines is ~45 tx each — below the 89 tx break-even. Four boxes also put ~₦15.4m of hardware and ~₦4.8m of cash on one pad.

Default: one machine per site. Two is a promotion. Four is a rare mega-node only.

5.3 Chain landlords

A master lease with a fuel-retail or hub chain (Total, MRS, Ardova, a bus-terminal or market company) is a **Phase 2 location channel**:

Place	Use
Petrol on market / park roads	Yes — one machine first
Parks, petty-trade streets, wholesale gates, junctions	Yes — one, then two if there is a queue
Malls	Maybe one at taxi rank / food-court cash line — not the ATM lobby

Malls rent cleanly. They are often weak for change because ATMs and cards already sit there.

5.4 Hotels and service amenities

Hotels and salons want a guest USP. CashEase needs 180 cash transactions a day.

	Volume site (core)	Amenity site (overlay)
Who	Markets, petty streets, bus waits, busy petrol	Hotels, salons, cinemas, offices
Why they say yes	Rent / small share	Convenience for their customers
Why CashEase says yes	Queue all day	They pay placement , or a two-week count is exceptionally strong

A lobby at 30–60 hits a day loses money unless the host pays. Keep amenity sites a small slice after the volume estate works. Never let them pull fleet-average traffic under 150 tx/day.

5.5 Operators, not franchise, for the first 2,000

Hosts already get rent $\pm$ 5–10%. That is the local partner.

Classic franchise (someone else buys the box and pays a royalty) splits cash control, small-note supply, and BOI collateral. Banks want one licensed operator. **Phase 1-2: own and operate.** After a working 2,000, hired operators or one **city operator** under the company licence — CashEase still owns the machines; float stays bank → company → cassette.

5.6 Cash and small bills

CBN depots serve banks and licensed CIT, not a private kiosk company.

- Phase 1:** self-fund **₦1.2 million** per kiosk, weighted to ₦100/₦200/₦500. Recycle small notes taken in.
- From Year 2:** a partner bank supplies most of the float (planning: CashEase still funds 35% at 2,000 units, falling toward 15% at large scale).
- Replenishment SLA:** e.g. 40% ₦100/₦200, ₦50 if available, rest ₦500.
- Design around ₦100–₦500, not vanished coins.
- Match cassette limits and CIT to agent cash-out rules in force.

If the hopper is ₦500s, the conductor walks away and the majority demand never hits the machine.

5.7 Cadence and security

Rhythm	Action
Continuous	Telemetry on cassettes, jams, power, GPS
Daily	Exception CIT; reconcile; AML flags
Weekly	Planned CIT; denomination rebalance; host check-in
Monthly	Site P&L; relocate the bottom decile
Quarterly	OEM parts; acquirer fees; circular check

Staffing in the model: one technician per 40 kiosks, one monitor per 80, plus HQ.

Planning puts **1.2% of gross** in theft/loss and **1.6% of machine+float** in insurance. Caps, CIT, insurance that pays on market theft, and a **72-hour pull right** are operating rules, not appendix colour.

6. Banks, Regulation & Policy

6.1 Device class

Classification	Phase 1 stance
Kiosk + POS via a licensed acquirer	Start here
PTSP	File as the fleet grows beyond a handful of partner terminals
IAD	Only if the product is an ATM in CBN's eyes
Bank / MFB	Out of scope

Counsel classifies the transaction set **before** 350 units are paid for. Marketing does not call the box an ATM replacement unless it is one.

6.2 The bank deal

Signing a bank for **cash and settlement after 300-500 live kiosks** is a normal IAD/PTSP path. Signing one on Day 1, with no volumes, is early. Vestibule placement can appear later as an extra site with a hard share cap; it is not the estate.

Negotiate in writing: ownership stays with CashEase; replenishment cadence and mix; 3-5 year term; 70% + operator share as the opening ask; exit if cash SLAs fail.

A sample proposal is in [Appendix B](#).

6.3 Policy

CBN can recognise, sandbox, or make it easier for banks to load small notes. It does not buy kiosks, fill cassettes, or lend ₦90 billion to this company. A supportive letter helps a BOI file. The contracts that run the business remain: **host, bank, then investors/BOI**.

7. Growth Roadmap

Figure: Planning fleet 350 → 2,000 → 5,000 → 10,000 → 15,000 → 20,000. Stress grows slower and loses money. Upside starts at 500 and reaches 20,000 in Year 6 if traffic is fatter.

7.1 Phases

Phase	When	Fleet (year-end)	Purpose	Gate
0 — Prototypes	Months 0–4	5–10	OEM and Naira firmware	60-day uptime ≥ 90%
1 — Proof	Y1 (2027)	350	Everyday-street sites, self-funded float	Median ≥ 150 tx/day; theft < 2%; 6 months of books
2 — Repeatable	Y2 (2028)	2,000	Bank cash line; Lagos-Ogun-Ibadan density	Bank SLA; unit EBITDA on plan; DSCR for any facility
2b — National core	Y3 (2029)	5,000	Abuja, Kano, PH, Onitsha	Two banks or bank + CIT
3 — Option	Y4–Y6	10,000–20,000	Only if planning unit economics still hold	Facility sized to DSCR ≥ 1.25×

7.2 Phase 1 calendar

Window	Work
Months 0–2	Incorporate; counsel memo; acquirer term sheet; OEM shortlist; 30-site longlist
Months 2–4	5–10 units land; workshop; two live sites; insurance
Months 4–8	30–50 unit pilot; first 15 leases; PTSP/acquirer filings
Months 8–12	Scale to 350 if medians hold; bank conversations with data
Year 2 H1	Bank cash agreement; Phase 2 batch against that agreement

7.3 Nationwide

Nationwide is how a 5,000–20,000 fleet is **housed**. It does not raise profit per box.

Nigeria has far more than 20,000 everyday cash streets. The plan needs 20,000 **CashEase doors** — pads where people already buy, wait, and board, that still clear ~89 tx/day after agents and informal change. That subset is counted on the street, not assumed from famous place-names.

Cover one belt like ATMs, then copy hubs. A second bank or national CIT is in place before vans leave the first belt.

7.4 Path to 20,000

Stage	Fleet	Money	Gate
1	350	₦1.85bn equity	OEM trial; site counts
2	2,000	₦8–12bn BOI/club	Median $\geq$ 150 tx/day; bank SLA
3	5,000	Next ₦15–25bn	Four clean quarters at 2,000; DSCR $\geq$ 1.25x
4–5	10,000 → 20,000	Further tranches + retained profit	New cities still near 180 tx/day

Hardware on planning assumptions is about **₦3.85m × 20,000 ≈ ₦77bn** over six years. Float is about **₦24bn** in the field — mostly the bank's. If Stage 1 or 2 misses, the company stops at the last working scale. That is by design.

8. Financial Plan

Three unlevered cases share 30% CIT + 3% education tax on PBT, five-year straight-line on machines and fit-out, and a 22% discount rate.

Assumption	Stress	Planning	Upside
Year-end fleet Y1→Y6	200–1,200–2,500–5,000–8,000–12,000	350–2,000–5,000–10,000–15,000–20,000	500–2,000–5,000–10,000–16,000–20,000
Tx / up day	110	180	225
Uptime	85%	92%	93%
Blended fee	₦70	₦100	₦115
Gross / kiosk / month	₦199k	₦504k	₦732k
Bank share (from Y2)	38% of 70% of gross	32% of 55% of gross	30% of 50% of gross
Logistics	32% of gross	24%	22%
Site rent / month	₦120k	₦80k	₦70k
Unit CapEx (hw + fit-out)	₦4.95m	₦3.85m	₦3.30m
Theft / loss	3.5% of gross	1.2%	0.8%

Planning is the go / no-go case. Stress is weak doors. Upside is fatter traffic and fees on the same model.

Figure: Stress loses money at every scale. Planning is profitable at 2,000 and beyond. Upside is the fat-traffic case.

8.1 Phase 1 sources and uses (planning)

Use	₦
350 × ₦3.85m machines and fit-out	1.35 billion
350 × ₦1.20m self-funded float	420 million
HQ, licences, legal, first insurance	80 million
Total opening equity	1.85 billion

Fund with equity. A development bank will ask for the data Phase 1 is meant to produce.

8.2 Break-even

	Stress	Planning	Upside
EBITDA break-even (tx/day, bank share on)	286	89	62
Assumed tx/day	110	180	225
Margin of safety	-160%	+51%	+72%

Planning has a real cushion **if** 180 transactions happen. Stress has none. Site selection is a binary risk.

Planning revenue mix — multi-service kiosk

Figure: About 45% note-breaking, 40% POS, 15% airtime/bills/ads. Change is the stop; POS is the volume engine.

8.3 Six-year unlevered P&L (planning — path that can reach 20,000)

Year	Fleet (end)	Gross	EBITDA	NPAT	FCF	NPAT margin
Y1 2027	350	₦1.06bn	₦0.35bn	₦0.05bn	₦0.32bn	5.0%
Y2 2028	2,000	₦7.10bn	₦1.85bn	₦0.21bn	–₦5.02bn	3.0%
Y3 2029	5,000	₦21.16bn	₦5.88bn	₦1.38bn	–₦6.98bn	6.5%
Y4 2030	10,000	₦45.33bn	₦12.83bn	₦3.48bn	–₦8.97bn	7.7%
Y5 2031	15,000	₦75.56bn	₦21.64bn	₦6.85bn	–₦1.15bn	9.1%
Y6 2032	20,000	₦105.78bn	₦30.45bn	₦10.22bn	₦5.47bn	9.7%

Y2–Y5 free cash flow is negative while machines are bought faster than they earn. That is why a sprint to 20,000 on equity alone has a **–₦11.6 billion** NPV at 22% even though Year 6 NPAT is ₦10bn. Scale is not the same as value. The plan therefore **holds at 2,000** until debt and traffic justify the next step.

8.4 Hold cases — what a lender can discuss

Path	6-year IRR	NPV @ 22%	Role in the plan
Hold 350	11.1%	−₦448m	Proof engine
Hold 2,000	21.2%	−₦89m	First operating scale (~₦1.2bn NPAT/year)
Hold 5,000	19.1%	−₦571m	Next hub scale if 2,000 holds
Sprint 20,000 unlevered	n/m	−₦11.6bn	Not how the plan funds itself
Upside sprint 20,000	84.5%	+₦18.2bn	If 225 tx/day and ₦115 fees hold fleet-wide

Figure: Value shows up when growth is paced or when a right-sized facility funds a 2,000 hold.

8.5 Upside case

If the fleet does 225 tx/day at ₦115 with leaner costs, Year 6 NPAT is **₦39.3bn** on ₦158bn gross. That is the fat-traffic case for the same business, not a different model.

9. Funding

9.1 Sequence

1. **Equity ₦1.85bn** — 350 kiosks.
2. **After 6-12 months of books** — BOI or a bank club, **₦8-12 billion**, machines as collateral, cash-supply bank in the room, step to 2,000.
3. **After four clean quarters at 2,000** — a second tranche in the ₦15-25bn class only if traffic is on plan and combined DSCR stays $\geq 1.25\times$.
4. **Larger syndicate** — only once 5,000 kiosks exist.

Facilities in the model: 9% interest, amortisation from Year 3.

Facility	Against	Equity NPV @ 22%	Minimum DSCR	Credit read
₦8bn in Y2	Hold at 2,000	+₦2.50bn	1.96×	Sized for Phase 2
₦25bn in Y2	Hold at 5,000	+₦7.35bn	0.82×	Tight for planning cash flow
₦15bn + ₦15bn	Hold at 5,000	+₦7.94bn	0.91×	Still tight
₦90bn on a 20,000 sprint	Full path	+₦11.25bn	0.46×	Does not service on planning traffic
₦90bn on upside traffic	Full path	+₦42.4bn	1.06×	Barely 1× — not a comfortable DFI credit

Figure: The ₦8 billion facility on a 2,000-kiosk hold clears a 1.25× comfort line. A ₦90 billion ticket on a 20,000 sprint does not.

9.2 Institutions

Institution	Role
Promoter / angels / small strategic	Phase 1 equity
Commercial bank	Cash float, settlement, later co-lender
Bank of Industry	Best DFI fit after 300–500 live kiosks: longer tenor, machines as collateral
CBN	Regulator and possible recognition — not a lender to this company
DBN	Unlikely as a large direct ticket

9.3 What ₦90 billion means on this plan

The cap on ₦90bn **profit** or a **₦90bn single loan** is the model: thin fees, one queue per pad, rent, CIT, bank share. Nigeria has enough busy areas; it does not automatically have 20,000 fat CashEase pitches.

If ₦90bn means...	On this plan
One loan	Not as a first ticket. ₦8–12bn after 350, then tranches.
Yearly profit	Planning ~₦1.2bn at 2,000; ~₦10bn at 20,000 good machines; upside ~₦39bn.
Yearly revenue	~₦12bn at 2,000; ~₦106bn at 20,000 × 180 tx/day — earned, not Year 1.
Company value	Only after years of held profits.

10. Cost-Benefit

Stage	Cost	Benefit if gates pass
350	₦1.85bn equity	Proof; ~₦0.5m gross / box / month; bank will talk; owned assets
→ 2,000	₦8–12bn facility	~₦1.2bn NPAT/year; loan at ~2× DSCR — best risk-adjusted scale
→ 5,000	Next ₦15–25bn	National core if 180 tx/day still holds
→ 20,000	~₦77bn hardware over years + ~₦24bn cassette cash (mostly bank)	Option on ~₦106bn revenue / ~₦10bn NPAT

Who keeps the benefit: CashEase (change fees + ~60–75% of POS; the boxes); bank (~25–40% of POS and the float); host (rent ± 5–10%).

10.1 How to maximise gain

1. Put money into **everyday doors**, not OEM volume. Kill pads with no people monthly.
2. Keep change cheap enough to stop the conductor; push POS and bills on the same screen.
3. Own the box, rent the cash; hold 70%+ of POS.
4. Add machines only when the last 50 are above 150 tx/day.
5. Uptime ≥ 92%; theft < 2%; ₦100–₦500 in the hopper.
6. Borrow **₦8–12bn** when 2,000 is the next step — not ₦90bn on a map.

11. Risk

Risk	Likelihood	Impact	Mitigation
Empty pads (no daily cash moments)	High if rushed	Fatal	Two-week people counts; kill bottom decile; cap Phase 1 at 350
Small-note scarcity	High	High	Bank mix SLA; ₦100–₦500 design; recycle
Theft / vandalism	High	High	Caps, CIT, insurance, 72-hour pull
Device reclassified as ATM	Medium	High	Counsel before OEM scale; IAD file ready
Bank or acquirer walks	Medium	High	Two acquirers by 500 kiosks; SLA penalties
FX on OEM batches	High	Medium	Quote in USD/RMB; 20% buffer; no 2,000 PO before data
POS giants add a change module	Medium	Medium	Speed on leases and telemetry
Over-ordering	High	Fatal	Board: no facility > 1.5× next-24-month capex
Digital payments thin cash-out	Medium (slow)	Medium	Bundle bills/airtime
Counterfeit	Medium	Medium	Validator grade; cassette quarantine

The model fails from **doors and cash logistics**, not from an inability to source a kiosk. The second failure mode is buying a national grid before 350 boxes have books.

12. Environmental, Social & Governance

12.1 Environmental

Solar-first kiosks; CIT vans are the larger footprint — hence density in Lagos/Ogun first. OEM take-back for validators and batteries.

12.2 Social

Small-note access on everyday streets. Existing petty businesses keep sales and can grow turnover without a trek. Jobs at 2,000 units in tech, monitoring, CIT and HQ. Host rent is part of the licence to operate. AML/CFT via the acquirer: thresholds, geotag, screening.

12.3 Governance

Single-purpose Ltd. Reserved matters: debt above ₦2bn, OEM POs above 50 units, device-class change. Monthly kiosk P&L to the board. External audit from Year 1. All machines are company assets.

13. Strategy to maximise potential

The job is to **stand where people already stop for daily cash** and stack every door-opener that makes a live hopper possible: private leases, public concessions, bank float, a thin ATM sidecar. Do not wait for one saviour (CBN, vestibules, franchise, or a federal PPP). Do not wait for a shortlist of famous crowd places.

Objective. Maximise **ATM-like availability** of stocked ₦100s on everyday streets, then an **inclusive, holistic stall OS** (cash → restock → goods on credit / BNPL) for traders Omni-class platforms skip —

company-owned boxes, cheap enough capital to reach 2,000 — without betting the firm on a factory portal or 20,000 iron sitting quiet.

13.1 Five tracks, in parallel (not in a queue)

Track	What you maximise	First move
A. Everyday doors	Capture of petty-trade / mallam / bus-wait / conductor pain — wherever people already are	10 OEM units; two-week people counts on ordinary streets; pay rent on the best 10–15 pads
B. Bank float	Small notes in the cassette	Acquirer now; cash SLA when 10–50 boxes have books. ATM-adjacent = pilot of 5–10 , not the estate
C. Public land	Official high-traffic slabs	Mini-concession: one park + one market street; you own machines; fee or small share to LGA/terminal
D. Policy story	Introductions, not a cheque	Liquidity-in-use + MSME growth (existing stalls) for BOI and bank desks
E. Trade-services platform	Inclusive stall OS: restock, then goods on credit / BNPL — Omni-class services for stalls they skip	After 30–50 live doors: cash restock first, small MOQ, no app required. Credit/BNPL only on named stalls with a partner book. Do not open a manufacturer portal

Track A **never pauses** for B, C, D, or E. E is the **platform** (restock → goods on credit → BNPL) after the hopper is in front of the stall. It must not eat the ₦1.85bn OEM-and-float cheque.

13.2 Sequence that compounds

- Create the first situations (months 0–6).** Walk ordinary streets: petty traders, mallams, bus waits, park edges, busy petrol. Count change-asks, lost fares, walked customers, people anticipating a trip. Order 10 machines. Go live. This is the new-category proof.
- Thicken the belt (months 6–12).** 350 doors in Lagos–Ogun until the product feels as available as an ATM in that catchment. One machine per pad. Kill pads with no people. When 30–50 doors are live, start **Track E** on named stalls: cash restock first, then goods on credit / BNPL with a partner book.
- Unlock float (months 9–18).** Bank adopts **cash + settlement** on your grid. Ask for a **vestibule sidecar** in the same paper — extra, not exclusive.
- Unlock public pads (in parallel).** Copy one working park or market-street concession to the next LGA. That is how government “adoption” becomes **land**, while the bank remains **cash**.
- Fund 2,000 (after books).** ₦8–12bn against machines + SLA. Best risk-adjusted scale (~₦1.2bn NPAT/ year on planning).
- Stretch equity only after 2,000.** Hire-purchase / operator-bought boxes, **gross** fee share on the switch, buyback, bank still owns float.
- Copy hubs, then 20,000 as operations.** Same everyday-coverage pattern in Ibadan, Abuja, Kano, PH. 20,000 is possible if B+C hold and doors stay fat — not if adoption means ATM lobbies only, and not if the map is only famous names.

13.3 What to push, what to refuse

Push hard	Refuse / delay
Pads on petty-trade streets, mallam corners, bus waits, park edges, busy petrol	Waiting for banks or a federal PPP to “approve the market”
Bank as cashier of ₦100s	Selling the fleet to banks as the core P&L
LGA/park concession for the slab	Nationwide exclusive that blocks private everyday streets
One box; second only if the queue is real	Four machines on one slab; only-famous-hubs thinking
70%+ of POS; change fees yours	Vestibule deal that forbids livelihood / street sites
Policy as a letter and intro	Policy as the revenue line
Help known stalls grow (leakage → restock → goods on credit / BNPL)	Day-one BNPL to strangers; CashEase as the lender of record on its own equity
Originate and collect; partner books the receivable	Become an unlicensed digital lender
Inclusive + holistic stall process (cash → crate → BNPL)	Clone OmniRetail’s factory dashboard in Year 1

13.4 How 20,000 becomes the upside, not the bet

Bank float + public concessions + a **dense first belt of everyday streets** is the **maximum-potential** shape — ATM-like coverage, then copied. Bank ATM sites add a slice of people who just withdrew large notes. Population and on-ground pain are why the ceiling can be high: **everyone** has the need, so money can follow availability. The first 350–2,000 are how you **create that convenience** in one catchment. If those print, you have earned the right to chase 20,000. If a pad is dead, you move it to where people already stop — you do not conclude the masses had no pain, and you do not conclude only Mile 12-class names work.

14. Implementation

#	Action	Owner	Timing
1	Incorporate; audit file; counsel memo (kiosk vs ATM vs IAD)	Promoter + counsel	Month 0–1
2	Shortlist two OEMs; order 10 units	Promoter	Month 1–2
3	Two-week counts on 40 everyday streets (petty trade, mallam, bus wait); sign ≤ 15 leases	Operations	Month 1–3
4	Acquirer term sheet	Promoter	Month 2
5	Run 10 units 60 days	Operations	Month 4–6
6	If medians ≥ 150 tx/day, complete 350 (₦1.85bn total uses)	Board	Month 6–12
6b	Track E: cash restock on named stalls; term-sheet a credit/BNPL partner (you originate, they book)	Operations + Promoter	After first 30–50 doors
7	Bank partnership on live volumes (Appendix B)	Promoter	Month 9–15
8	BOI/club file for ₦8–12bn , 2,000-kiosk hold	Finance	After 6–12 months of Phase 1
9	5,000 and a second tranche after four quarters at plan	Board	Year 3

CashEase is a **Nigerian multi-service cash-kiosk operator that owns its boxes and rents its float from banks**. It puts ATM-like availability on the majority's daily cash moments — petty traders, mallams, bus waits — so money can follow convenience. The stall's offer is a **platform of services**: keep the sale, restock, then goods on credit and BNPL. It rents like a shop: many ordinary doors in one belt, **one machine per pad**.

Raise **₦1.85 billion**, build **350**, then borrow for **2,000**. Nationwide hubs and any **₦90 billion** turnover story are earned after those doors print.

15. Appendices

A. Glossary

Term	Meaning
Change / note-breaking	Accepting a larger Naira note and dispensing smaller notes
CIT	Cash-in-transit
DSCR	EBITDA / (interest + principal)
IAD	Independent ATM Deployer
NIBSS	Nigeria Inter-Bank Settlement System
NPAT	Net profit after tax
PTSP	Payment Terminal Service Provider
Planning case	Go / no-go assumptions
Stress case	Empty pads, expensive float, high theft
Upside case	Fatter traffic and fees on the same model

B. Sample bank partnership proposal

Send when Phase 1 data exist. Replace brackets.

To: Agency Banking / Digital Channels, [Bank]

From: CashEase Nigeria Ltd

Re: Agency partnership — cash provisioning and settlement for multi-service kiosks

Ask. A formal agency agreement under which the bank supplies mixed-denomination cash (including **₦50/₦100/₦200** as available) and NIBSS settlement for an initial **[300-500]** CashEase-owned kiosks in Lagos and Ogun, scaling to **2,000** within 18 months if SLAs hold.

What we own. All kiosks, site leases and brand.

What we need. Cassette cash, denomination mix SLA, settlement, compliance channel. We deploy, maintain, insure and geotag.

Economics (opening ask). 60–75% of eligible POS/acquiring economics to CashEase; change fees to CashEase; site rent on us. Co-brand optional.

Why it helps the bank. Non-branch cash footprint, float turn, volume, density without buying the hardware. Live grid of existing micro-businesses that can grow turnover when small notes (and later restock) sit on their street.

Attachments (when live). 13-week kiosk P&L, uptime, fraud/theft, denomination shortages, machine specs, insurance, CAC/KYC, counsel memo on device class.

C. BOI file outline (after Phase 1)

Use with **300-500 live kiosks** and an audit.

1. Sponsor, ownership, reserved matters
2. Regulatory memo and licences
3. Bank cash agreement (signed or near-final)
4. Fleet register and valuations (collateral)
5. 12-month accounts and kiosk cohort P&L
6. Use of proceeds: machines, fit-out, residual self-float — no 20,000-unit PO
7. Planning, stress, and hold-at-2,000 cases
8. DSCR, collateral cover, insurance
9. Jobs, inclusion, and growth of existing everyday-street businesses
10. Requested ticket: **₦8-12 billion**, 7-10 years

D. Model files

File	Role
model/financial_model.py	Six-year three-case model, hold cases, BOI overlays, break-even

E. Document control

Version	Date	Notes
2.0	18 Aug 2026	Standalone plan: verdict as the opening design; livelihood-path demand; measured scale
2.2	18 Aug 2026	On-ground pains as demand validation; kiosk tx/day as the meter, not the proof of need
2.3	18 Aug 2026	Strategy to maximise potential: four parallel tracks, sequence, 20,000 as earned ceiling
2.4	18 Aug 2026	Pain follows people: ATM-like everyday convenience (petty trader, mallam, bus wait); named hubs are density, not the strategy
2.5	30 Aug 2026	Value proposition: help existing stalls grow (stop leakage → restock → credit); Track E
2.6	30 Aug 2026	Curating SKUs/playbook is in; per-stall management consulting is not the estate
2.7	30 Aug 2026	Growth layer restated as a trade-services platform: goods on credit and BNPL; CashEase originates, partner books
2.8	30 Aug 2026	Positioning vs OmniRetail: inclusive (cash-first, smaller stalls) and holistic stall process; do not clone the factory portal

Next refresh triggers: counsel memo received; 60-day OEM trial closed; first 15-site counts complete; any circular on IADs, agent cash caps or POS geotagging.
