

CashEase Nigeria

Feasibility Study

Independent multi-service cash kiosks — note-breaking, POS cash-out, airtime and bills. Own the machines. Partner with banks only for cash and settlement. One machine per counted pitch. Prove 350, then fund 2,000. Treat 20,000 kiosks and ₦90 billion as an earned option, not a Year-1 plan.

Prepared	August 2026 · v1.1
Horizon	6 years (2027–2032) · 350 → 2,000 → earned scale
Opening equity	₦1.85 billion for 350 kiosks (planning case)
Planning unit	180 tx/day · ₦100 blended fee · break-even 89 tx/day
Best scale	Hold at 2,000 with an ₦8–12 billion facility (DSCR ~2×)
Classification	Planning document — not financial, legal, tax or investment advice

Independent Multi-Service Cash Kiosks

Note-breaking · POS cash-out · Airtime and bills
Nigeria — starting in Lagos / Ogun, then national

A study of the progressed plan: own the machines, do not sell them to banks or the CBN, partner with banks only for cash and settlement, and scale only after proven traction. The conversation’s 20,000-kiosk / ₦90 billion ambition is treated as an earned option, not a Year-1 commitment.

Field	Detail
Working name	CashEase Nigeria Ltd (legal name to be confirmed)
Prepared	August 2026
Source plan	Shared Grok conversation, 17 Feb – 22 May 2026 (change-machine thread)
Horizon	Year 1–Year 6 (2027–2032)
Currency	Nigerian naira (₦), nominal
Planning case	180 tx/day, 92% uptime, ₦100 blended fee, bank cash from Year 2
Classification	Confidential planning document

Purpose. This study extracts the change-machine business from the source conversation, states the **progressed final plan** (what survived after the model was challenged), and tests whether that plan is feasible. It covers the operating model, ownership, market, technology, locations (including chain leases, one-box-per-pad, hotels as amenity), cash supply, regulation, franchise, a three-case six-year financial model, cost-benefit, what “₦90 billion” can and cannot mean, nationwide versus density, risk, and the only scale that should be committed now.

Disclaimer. Figures are illustrative projections on stated assumptions. They are not guarantees. Desktop estimates from the source conversation have been haircut and stress-tested; they are not audited market research. This document is not financial, legal, tax or investment advice. Independent professional advice is required before capital is committed.

1. Executive Summary

The progressed plan is **not** “design a Naira change machine in China and sell it to banks at ATM vestibules for a commission.” That idea was tested in February 2026 and discarded. The plan that survived by May 2026 is:

1. **Own 100% of the kiosks.** Banks do not buy the hardware. They may supply cash and settlement.
2. **Sell a bundle, not a novelty.** Each kiosk breaks notes **and** does POS cash-out, airtime, bills and (later) ads. Pure change fees do not carry the P&L.
3. **Sit in cash-heavy non-bank sites** — markets, motor parks, fuel stations, campuses — not inside bank branches.
4. **Prove 200-500 units**, then 2,000, then (only with data and a bank cash line) 5,000–20,000.
5. **Treat CBN endorsement as a signal, not a cheque.** Large money, if any, comes from the Bank of Industry (or a syndicate) after traction — and ₦90 billion is a later, staged ask, not an opening facility.

That model is the right one for Nigeria’s cash-plus-agent economy. The **numbers attached to it in the source conversation are not**. At 2,000 machines the conversation projected ₦12–24 billion annual net profit and 40–55% net margins. A full cost stack (site rent, cash logistics, bank revenue share, field staff, insurance, theft, depreciation and tax) produces planning-case net margins of about **3–10%** on the way to scale, and about ₦1.2 billion NPAT on a **held** 2,000-kiosk fleet — an order of magnitude below the desktop plan.

Key figures at a glance — planning case

Metric	Value
Recommended first commitment	350 kiosks (mid-point of the 200–500 proof band)
Opening equity	₦1.85 billion (₦1.35bn machines + ₦420m self-funded float + ₦80m HQ/licences)
Unit CapEx	₦3.50m hardware/software + ₦0.35m site fit-out = ₦3.85m
Self-funded float, Phase 1	₦1.20m per kiosk (banks take most of this from Year 2)
Assumed traffic	180 transactions/day · 92% uptime · ₦100 blended fee
Gross per kiosk / month	₦504,000
EBITDA break-even (bank share on)	89 tx/day (51% margin of safety vs 180)
Phase 1 hold (350, 6 years)	IRR 11% · NPV at 22% –₦448m
Hold at 2,000	IRR 21% · NPV at 22% –₦89m (around the hurdle)
Unlevered sprint to 20,000	NPV at 22% –₦11.6bn — growth capex destroys value
₦8bn BOI on a 2,000 hold	Equity NPV +₦2.50bn · min DSCR 1.96x
₦25bn BOI on a 5,000 hold	Equity NPV +₦7.35bn · min DSCR 0.82x (too large)
₦90bn BOI on the 20,000 path	Min DSCR 0.46x — not bankable on planning economics
Promoter (Grok-plan) 20,000 path	NPV +₦18.2bn · IRR 85% — only if traffic and fees hit the conversation’s “realistic” band

Figure: Only Phase 1 is a present commitment. 2,000 and 5,000 are the first earned scales. 20,000 is an option, not a plan.

Feasibility verdict

Question	Verdict
Is the model feasible?	Yes. Own the assets, bundle change with POS and bills, place in non-bank cash sites, use banks for float and small notes.
Is Phase 1 (~350 kiosks) feasible?	Yes, as a proof engine — if ₦1.85bn of equity is available and locations are chosen one-by-one. It does not, by itself, clear a 22% cash-handling hurdle. That is acceptable for a pilot. It is not a reason to raise ₦90bn.
Is 2,000 kiosks feasible?	Conditionally yes. Requires Phase 1 unit economics at or above planning, a signed bank cash agreement, and either retained cash plus a right-sized facility (about ₦8bn, not ₦90bn) or a slower self-funded ramp.
Is 20,000 kiosks / ₦90bn feasible now?	No. Not on planning economics, not without years of audited traction, and not as a single ticket. CBN “backing” does not substitute for repayment capacity.
Is the stress case feasible?	No. At 110 tx/day and ₦70 fees the kiosk never covers rent, logistics and bank share (break-even 286 tx/day). Weak locations kill the firm.

Go / no-go for capital today: go **only** on Phase 1. Do not order 2,000 machines, do not submit a ₦90 billion BOI file, and do not frame the product as a CBN circulation programme until 6–12 months of kiosk-level data exist.

What “₦90 billion” can mean (planning case)

Meaning	Feasible on this model?
One BOI / bank cheque	No — cash flow cannot service it (min DSCR ~0.46x on a 20,000 sprint)
Annual profit	No — ~₦10bn NPAT at 20,000 good machines; ~₦1.2bn at a held 2,000
Annual revenue	If earned — ~₦106bn gross at 20,000 × 180 tx/day; not a Year-1 number
Company value	Only much later, if profits stick — not a plan

The bottleneck on ₦90bn **profit** or a ₦90bn **loan** is **model capacity** (thin fees × one queue per pitch), not a claim that Nigeria lacks 20,000 busy places. Busy ≠ a 180 tx/day CashEase door.

2. How the Plan Progressed

The source conversation is a single thread that begins as a tomato-farm plan and, from 17 February 2026, opens a second business: a custom Naira change machine. The change-machine idea was then challenged, narrowed and restated in May 2026. This study uses **only the version that survived**.

2.1 Ideas that were dropped

Early idea (Feb 2026)	Why it was dropped
Sell machines to banks for ATM vestibules and take a per-transaction commission	CBN ATM rules, bank preference to own their cash network, long procurement, low share of fee
Sell hardware/software to the CBN as a “put money in circulation” programme	CBN is not a commercial buyer of kiosks; it does not supply cash to private operators
Pure note-to-coin box with no other services	Fee per change is too small unless traffic is extreme
Jump to 10,000–50,000 units on a CBN letter	No licence path, no float, no locations, no data

2.2 The progressed final plan (May 2026)

After the questions “best model?”, “own or sell?”, “2,000-machine P&L?”, “locations and CBN cash?”, “where do small bills come from?”, “then 20,000?”, “do I still own the machines?” and “can traction unlock ₦90bn?”, the plan is:

Element	Final position
Asset ownership	Promoter owns 100% of kiosks at every scale
What the bank owns	The cash float inside the machine (once a partnership is signed), plus settlement
Revenue share	Target 60–75% to CashEase / 25–40% to the bank on eligible (mainly POS) flows; change fees stay with the operator
Product	Multi-service kiosk: note-breaking + POS + airtime/bills + optional screen ads
Sites	Non-bank, high-footfall, cash-heavy
Legal wrapper	Ltd company; PTSP and/or IAD registration; acquirer/bank agency for settlement
Hardware	China OEM, custom Naira validators and dispensers, remote monitoring, solar/battery
Cash & small notes	Through partner banks (and recycling at own sites). Not from CBN vaults.
Scale	Phase 1: 200–500 → Phase 2: 2,000–5,000 → Phase 3: 10,000–20,000 only after proof
Funding	Equity and retained profit first; BOI in tranches after 300–500 live kiosks; ₦90bn is a later syndicate ask, not a Day-1 loan
CBN role	Policy alignment, possible sandbox/recognition, not a lender

The rest of this study is a feasibility test of that plan, not a reprint of the conversation’s revenue tables.

3. Business Overview & Strategic Model

3.1 Concept

CashEase deploys unmanned (or lightly attended) **multi-service cash kiosks** that:

- accept large Naira notes and dispense smaller notes and, where stock exists, coins;

- offer POS cash withdrawal (and, where the acquirer allows, deposit);
- sell airtime, data and bill payment;
- later, sell screen advertising and (only with a licence) adjacent services.

The customer is the cash-using public in markets and transport nodes. The economic customer is also the **partner bank**, which wants float utilisation, agent-network reach and help against CBN ATM-density pressure — without buying or maintaining the box.

3.2 Why owning beats selling

Selling machines or software to banks/CBN was rejected because:

- banks already have vendors and want control of ATM estate;
- IAD/ATM rules force bank settlement, PCI-grade security and interoperability anyway — so the hard work of “selling in” does not remove regulation;
- a hardware sale is a one-time margin; a owned kiosk is a daily fee stream;
- CBN does not write cheques for private kiosk fleets.

Owning keeps the asset on the balance sheet (collateral for a later facility), keeps most change and a majority of POS economics, and still allows a bank to supply cash. That is how successful independent ATM deployers and large PTSPs already work in Nigeria.

3.3 Value proposition

Party	Why they use CashEase
Public	Faster change than a trader; cash-out without a bank queue; airtime/bills in one stop
Site host (market, park, fuel station)	Rent + optional 5–10% site share; less “no change” friction for their own customers
Partner bank	Extra acquiring volume, float turn, non-branch footprint, contribution to ATM/agent density
CBN (indirect)	More small-denomination circulation if banks actually load small notes — a policy story, not a contract

3.4 Competitive advantages (if executed)

- **Bundled trip.** A change-only box loses to the man with a drawer of ₦100 notes. A box that also pays out POS cash and sells airtime wins the same queue POS agents already own.
- **Owned estate.** Locations and machines are transferable, financeable and not hostage to a single bank’s hardware RFP.
- **Denomination discipline.** The product is designed around ₦100/₦200/₦500, not vanished ₦5–₦20 coins.
- **Data.** Remote cash-level and uptime telemetry is the leverage for the bank conversation after Phase 1.

None of these advantages exist until Phase 1 is live. They are not reasons to skip the pilot.

3.5 SWOT

	Helpful	Harmful
Internal	Clear ownership model; bundle matches how Nigerians already use agents; China OEM path is real	Cash logistics and theft; float lock-up before a bank line; weak in-house payments licence
External	Persistent cash use; ATM-density pressure on banks; agent-banking precedent	CBN can reclassify devices; small-note scarcity; POS aggregators (Moniepoint, OPay, PalmPay) already sit in the same sites

4. Market Analysis

4.1 Why a change machine exists at all

Nigeria remains a **cash-plus-digital** economy. Large notes are easy to get from ATMs and agents; small notes and coins are not. Markets, danfo/okada fares, and stall trade still require broken money. That gap is the only reason to build a specialised dispenser. It is **not** large enough, on change fees alone, to justify the CapEx.

The source conversation's February 2026 market colour (high currency-in-circulation, strong ATM withdrawal value, tolerance for small access fees) is directionally right and should be replaced, before a BOI file, with:

- current CBN currency-in-circulation and denomination mix;
- NIBSS / acquirer volumes for POS cash-out in the target LGAs;
- a two-week **manual count** of change events at each candidate site (people asking “do you have ₦100s?”).

Until those three exist, every revenue table in this document is a scenario, not a forecast.

4.2 The real market is the agent-cash market

The comparable business is **not** a bank ATM. It is the POS/agent kiosk that already earns ₦150,000–₦700,000+ net in a good month in a prime spot — the benchmark the source plan used. CashEase is an attempt to **own the box** and add a change module on top of that proven demand.

Addressable demand is therefore:

- **Primary:** cash-out and change at 50–150 prime Lagos/Ogun nodes (Phase 1).
- **Secondary:** the same pattern in Abuja, Kano, Port Harcourt, Ibadan, Onitsha (Phase 2).
- **Not addressable without a licence change:** bank vestibules, “CBN-mandated” placement, or coin-only public service.

4.3 Pricing power

Nigerians already pay ATM surcharges and agent fees. A ₦20–₦100 change fee and a ₦50–₦200 POS fee are in-market **if** the alternative is a 20-minute hunt for change. Pricing power dies if:

- the machine is empty of small notes (the core operational risk);
- a human agent next door is cheaper and talking;
- the site is a mall with working ATMs and card-accepting shops.

4.4 Competition

Competitor	What they already do	Implication
Moniepoint, OPay, PalmPay, bank agents	POS cash-out, deposits, bills, in the same markets	CashEase must partner or differentiate (change module + owned hardware), not out-agent them on brand
Informal changers	Instant, flexible, sometimes better small-note stock	Compete on safety, hours and reliability — not on warmth
Bank ATMs	Cash-out of larger notes; poor small-note mix	Adjacent, not the same job; vestibule placement remains unlikely
Future bank or fintech kiosks	Anyone can add a recycler	Speed of Phase 1 data and site leases is the moat, not the OEM drawing

4.5 Africa expansion

The February thread asked about Ghana, Kenya and South Africa. **Out of scope for this study.** Currency homologation, local cash-in-transit and a second central-bank relationship are a Phase 3-after-Nigeria problem. Mentioning them in a Phase 1 information memorandum would weaken, not help, a BOI conversation.

5. Product, Technology & Supply

5.1 Machine specification (minimum viable)

Function	Requirement
Accept	₦200, ₦500, ₦1,000 (and ₦100 if validator supports it) with UV/MG/IR counterfeit checks
Dispense	₦50 / ₦100 / ₦200 / ₦500 cassettes; coin hopper optional (do not depend on coins)
POS	Certified PED / Android POS or integrated acquiring app via a licensed acquirer
Power	Solar + battery sized for 12–16 hour market days; generator only as site backup
Security	Safe, shock/tilt sensors, cameras, GPS, remote inhibit, limited cassette value
Software	Naira denomination maps, remote cassette levels, lockout, reconciliation file, bilingual UI
Uptime target	95% (planning models 92%)

Unit cost used in the planning case: **₦3.5 million** landed, configured and with Naira software, plus **₦0.35 million** site fit-out (plinth, cage or shopfront, branding, solar). Stress uses ₦4.5m + ₦0.45m. Promoter uses ₦3.0m + ₦0.30m.

5.2 China OEM path

The source plan's OEM route is technically sound. Chinese firms already ship bill validators, hoppers and kiosks into Africa. The feasibility issues are not “can China build it?” They are:

- **Naira note updates.** New series or substrate changes brick unpatched validators. Contract for firmware SLAs and a local spare pool.
- **Lead time.** Budget 12–16 weeks order-to-Lagos for the first 50, then a rolling 8–10 week cadence. Do not pay for 350 units before 10 units survive a 60-day site trial.
- **Spare parts and skilled techs.** A 350-unit fleet needs a Lagos workshop and a parts kit per 20 machines. This is in the field-staff line, not in the Alibaba quote.

- **FX.** Machines are a dollar (or RMB) cost. A 20–30% naira slide between order and landing is in the stress unit CapEx, not as a separate hedge P&L.

Procurement rule: 5–10 prototype units → 30–50 pilot → only then the balance of Phase 1. The conversation’s “commission 5–10 then pilot” step is retained as a hard gate.

5.3 Software and the “sell the stack to CBN” temptation

Custom software is required for denominations, telemetry and reconciliation. It is **not** a second business in Phase 1. Licensing the stack to banks or the CBN is a Year 4 option once 2,000 machines have produced a year of clean logs. Building a sales motion for that option now would recreate the discarded model.

6. Locations, Cash & Operations

6.1 Location is the business

The source plan is correct: **location quality dominates software quality**. The planning case assumes 180 paid transactions per up day. The stress case (110 tx/day, ₦70 fee, ₦120k rent) never breaks even. That is a location result, not a China-OEM result.

Phase 1 site list (types, not addresses):

- Wholesale and retail markets (Mile 12, Oshodi, Tejuosho, Balogun-type nodes)
- Motor parks and last-mile junctions
- Busy fuel stations on market corridors
- Campus gates
- Hospital and large-church/mosque approaches only if a weekday count supports it

How a site is won (from the progressed plan, kept):

1. Count traffic at three day-parts for two weeks. Record existing POS/ATM and “change” events.
2. Offer the host a written lease: ₦50k–₦200k/month plus optional 5–10% of site-attributable net, with a 3-month performance guarantee in the host’s favour.
3. Use market associations / park leadership; register with the LGA; budget “area” risk explicitly rather than pretending it is zero.
4. Fix the terminal to the geotag the CBN now expects for POS.
5. Sign 12–36 month occupancy with relocation rights.

Budget **₦100k–₦300k** per prime site for deposit and first fit-out beyond the ₦0.35m unit setup. Phase 1 should not open the 50th site until the first 10 have four weeks of data.

You **rent space like any other business** — a lease with a landlord or stall owner, 12–36 months, ₦50k–₦200k/month on a prime pitch, optional 5–10% of that site’s net. You do **not** need a bank vestibule or a government allocation. You do **not** rent “anywhere”: a quiet shop fails the same 89 tx/day break-even as a weak hotel lobby.

Figure: On planning fees, a mature kiosk still has a thick logistics and rent stack. There is no 50% net margin after that stack.

6.2 Cash float and small bills

This is the operational heart of a change business and the point the May conversation got right.

CBN will not load the machines. Only banks and licensed CIT companies draw from CBN depots. CashEase's path is:

1. **Phase 1:** self-fund **₦1.2 million** per kiosk, weighted to ₦100/₦200/₦500. Recycle small notes taken in at the same sites.
2. **From Year 2:** a partner bank supplies most of the float. Planning assumes CashEase still funds 35% of float at 2,000 units, falling to 15% at 20,000.
3. **Request mix** on every replenishment: e.g. 40% ₦100/₦200, 30% ₦50 if available, rest ₦500. Write this as an SLA, not a hope.
4. **Do not design the product around coins or ₦5-₦20 notes.** They are scarce. Dispense what the bank can actually deliver.
5. **Respect agent cash-out caps** (the conversation cited ~₦1.2m/day-class limits). Cassette limits and daily CIT cadence must match the rule in force, not the model's average.

At 2,000 machines a ₦1.2m float is **₦2.4 billion** of cash in the field. That is why the ownership table in §3 matters: if the bank owns the float, CashEase does not lock ₦2.4bn of equity in notes.

6.3 Operating cadence

Rhythm	Action
Continuous	Telemetry on cassette levels, jams, power, GPS
Daily	Exception CIT for empty/full cassettes; reconcile; AML flags
Weekly	Planned CIT; denomination rebalance; host check-in
Monthly	Site P&L; kill or relocate the bottom decile; insurance declarations
Quarterly	OEM parts review; acquirer fee review; CBN circular check

Field staffing in the model: **one technician per 40 kiosks, one monitor per 80**, plus a growing HQ. That is lean. A theft wave or a bad OEM batch will require more.

6.4 Security

Cash machines in Nigeria are stolen, burned and skimmed. The planning case puts **1.2% of gross** in theft/loss and **1.6% of machine+float value** in insurance. Stress uses 3.5% and 2.2%. Mitigations that must be in the opex, not the appendix:

- cassette value caps and time locks;
- CIT, not staff cars, above a set threshold;
- insurance that actually pays on theft in markets (read the exclusions);
- the right to **pull a site in 72 hours** if the host cannot keep the approach safe.

6.5 One queue, many doors — not four boxes on one slab

Measured rollout means **many machines in one corridor**, each on its **own** pitch. It does **not** mean “only one machine in Lagos,” and it does **not** mean four machines side by side as the national template.

Setup	Feasible?	Why
40 boxes across Mile 12, Oshodi, parks, petrol on the same roads	Yes — that is Phase 1-2	Different doors, different crowds
2 boxes at opposite ends of a huge market	Often yes	Two gates, two queues
2nd box on the same pad after the first is maxed (~250+ tx/day, real queues)	Yes, earned	Overflow, not a duplicate
4 side by side at one station, hotel or mall door	Usually no	Same people, split four ways → each can fall below 89 tx/day

A 180 tx/day pitch with four machines is ~45 tx each — all four below break-even. Four boxes also put ~₦15.4m of hardware and ~₦4.8m of cash on one pad (fatter robbery, messier geotag/cash-out caps). Shared rent helps a little; it does not create 4× customers.

Default: one machine per site. Two is a promotion. Four is a named mega-node only.

6.6 Chain landlords (petrol, hubs, malls)

A **master lease with a fuel-retail or hub chain** (Total, MRS, Ardova, a bus-terminal operator, a market company) is a Phase 2 **location channel**, not a CashEase franchise:

- Standard contracts; less one-off “area” chaos.
- Fuel stations on market/park roads were already on the good-site list.
- One CIT stop and one pad per station — still **one box first**.
- Nationwide chain rollout is how you house 2,000 sites after proof, not how you skip the 350.

Place	Use	Don't
Petrol stations on market / park roads	Yes — 1 machine first	4 at a normal filling station
Commercial hubs (parks, wholesale gates, junctions)	Yes — 1, then 2 if there is a queue	4 from day one
Malls	Maybe 1 at taxi rank / food-court cash line	ATM lobby; card-heavy malls; 4-pack

Malls look national and rent like a real shop. They are often **weak for change**: ATMs and cards already sit there.

6.7 Hotels and service amenities

Hotels, salons, cinemas and similar **want a USP**. CashEase needs **180 cash transactions a day**. Those are different jobs.

	Volume site (core)	Amenity site (optional extra)
Who	Markets, parks, petrol on busy roads	Hotels, salons, cinemas, offices
Why they say yes	Rent / small share	Convenience for their customers
Why you say yes	Queue all day	They pay you , or a two-week count is exceptionally strong

A lobby that does 30–60 hits a day is a loss-making kiosk on planning costs unless the host **pays placement**. Treat amenity sites as a small overlay **after** the volume estate works. Never let them pull fleet-average traffic under 150 tx/day. Never put four machines in a lobby.

6.8 Franchise is not the path to 2,000

Classic franchise (someone else buys the box, pays a royalty, runs the site) fights cash, small notes and the bank.

- Banks want **one** licensed operator, not 200 small franchisees loading ₦1.2m each.
- Franchisees will stock easy ₦500s; the change product dies.
- BOI wants **your** machines as collateral.
- Hosts already get rent ± 5–10% — that is the local partner, not a franchisee.

Now-Year 2: own and operate. **After a working 2,000:** hired operators or, later, one **city operator** on your licence (you still own the boxes; float stays bank → you → cassette). That can help 20,000 later. It does not replace Phase 1 equity or the ₦8–12bn step to 2,000.

7. Regulation, Banks & the CBN

7.1 What CashEase is — and must not become too early

Classification	When it applies	Phase 1 stance
Ordinary kiosk + POS via a licensed acquirer	Change box + agent-style POS	Start here
PTSP	Operating payment terminals as a service	File as soon as the fleet is more than a handful of “partner” terminals
IAD (Independent ATM Deployer)	If the box is an ATM in CBN’s eyes	Only if product scope requires it; heavier cash and scheme rules
Full bank / MFB	Taking deposits as principal	Out of scope

The progressed plan’s instruction stands: **avoid full ATM classification for as long as the product is honestly a kiosk + POS**. The moment cash-out is scheme-card ATM withdrawal, IAD + bank settlement is mandatory. Counsel should classify the intended transaction set before the OEM is paid for 350 units.

7.2 Bank partnership (the only realistic “CBN cash” path)

Direct CBN cash is not available. The workable structure, from the May plan and standard IAD/PTSP practice:

Aspect	Who
Kiosk hardware	CashEase — 100%
Brand and site lease	CashEase (optional co-brand)
Cash inside the cassettes	Partner bank, once the agreement is live
Settlement	Bank / NIBSS
Change fees	CashEase (subject to any agreed site share)
POS / acquiring fees	Split; target 60–75% CashEase
Relocation / removal	CashEase after notice

Negotiate in writing: ownership remains with CashEase; minimum replenishment cadence and denomination mix; 3–5 year term; 70%+ operator share as the opening ask; exit if cash SLAs fail.

A sample proposal (conversation text, edited) is in [Appendix B](#).

7.3 What “CBN backing” can and cannot do

The last question in the source thread was whether CBN backing is “enough” for ₦90 billion. The answer used here:

- CBN can **recognise**, sandbox, or write policy that makes banks more willing to load small notes and sign IADs.
- CBN can **convene** blended finance. It does not lend ₦90 billion to a private kiosk company.
- A supportive letter **helps a BOI file**. It does not replace audited volume, collateral and DSCR.

Pitching the product as “putting money in circulation” is a **policy narrative for banks and BOI**, not a revenue line.

Government endorsement is not the deal. CBN does not buy machines, load cassettes, or write the ₦8bn (or ₦90bn) cheque. A letter can make banks and BOI more comfortable. The contracts that run the business are: site host (rent), partner bank (float and settlement), then investors/BOI (equity then a right-sized facility).

7.4 Signing a bank is premature on Day 1, not impossible

Ask	Verdict
Bank loads small notes and settles POS after 300–500 working kiosks	Doable. Standard IAD/PTSP pattern. They take ~25–40% of eligible fees. This is the deal to sign.
Same ask before live machines	Too early. They will say come back with volumes.
Bank buys machines or lets you live on a commission next to their ATMs	Too ambitious as the core plan. They often want control plus a cut, or they say no. Do not build the company on vestibule space.
CBN signs as buyer, cash supplier, or ₦90bn lender	Not a path. Regulator, not a customer.

If a bank later offers a vestibule, treat it as an extra site with a hard revenue-share cap — not as the estate.

8. Growth Roadmap

Figure: Planning follows the conversation's 350 → 2,000 → 5,000 → 10,000 → 15,000 → 20,000 shape. Stress grows slower and still loses money. Promoter starts at 500 and reaches 20,000 in Year 6.

8.1 Phases (planning calendar)

Phase	When	Fleet (year-end)	Purpose	Gate to the next phase
0 — Prototypes	Months 0–4	5–10	OEM and Naira firmware live in one workshop and two sites	60-day uptime ≥ 90%; no unfixable validator failure
1 — Proof	Y1 (2027)	350	Location machine, self-funded float, first acquirer	≥ 150 tx/day median; theft < 2% of gross; 6 months of books
2 — Repeatable	Y2 (2028)	2,000	First bank cash line; Lagos–Ogun–Ibadan density	Bank SLA live; Phase 1 unit EBITDA ≥ planning; DSCR math for any facility
2b — National core	Y3 (2029)	5,000	Abuja, Kano, PH, Onitsha	Two banks or one bank + CIT; no regulatory reclassification shock
3 — Option	Y4–Y6	10,000–20,000	Only if planning unit economics have beaten the model for 4 quarters	BOI/syndicate sized to DSCR ≥ 1.25×, not to a ₦90bn headline

The conversation's Phase 3 (10,000 → 20,000, possible NGX listing, “₦120–250 billion net profit”) is recorded as **promoter ambition**. It is not in the recommended commitment.

8.2 Implementation timeline — Phase 1

Window	Work
Months 0–2	Incorporate; counsel opinion on kiosk vs ATM; acquirer term sheet; OEM shortlist; 30-site longlist
Months 2–4	5–10 units land; workshop; two live sites; insurance bind
Months 4–8	30–50 unit pilot; first 15 leases; PTSP/acquirer filings
Months 8–12	Scale to 350 only if pilot medians hold; start bank conversations with data, not decks
Year 2 H1	Bank cash agreement; order the Phase 2 batch against that agreement, not before

8.3 What must not happen

- Ordering 2,000 machines on the back of a China quotation.
- Signing 200 site “promises” without two-week counts.
- Submitting a ₦90bn BOI application from a spreadsheet and a Grok link.
- Expanding to Ghana/Kenya to make the story larger.

8.4 Nationwide versus density

Measured rollout is the idea. Nationwide **matters for scale** (you cannot put 20,000 good machines only in Lagos). It does **not** raise profit per box. It often lowers it.

Nigeria has far more than 20,000 busy places. That is not the same as 20,000 **CashEase pitches**. Busy mall, hotel or station traffic is often card/ATM traffic, or 80 cash-outs rather than 180. Agents already sit in the best doors. **20,000 machines means ~20,000 separate good doors**, not 5,000 areas × 4 boxes.

	Dense first (Lagos / Ogun / Ibadan)	Nationwide too early
Traffic	You can pick 180 tx/day pitches	Many state capitals will not hit 89 tx break-even
Cash / small notes	One bank, one CIT loop	Second bank, thin depots, empty ₦100 cassettes
Path to ₦90bn revenue	Caps out (not enough mega-pitches in one city)	Required if you ever want ~20,000 boxes
Path to ₦90bn profit	Still no	Still no

Win one corridor, then copy hubs (Kano, PH, Onitsha, Abuja). Covering 36 states in Year 1 is coverage, not gain. A second bank or national CIT is signed **before** the vans leave Lagos.

8.5 Path to 20,000 (earned option)

20,000 is not viable as a first raise or a CBN play. It is viable only as:

Stage	Fleet	Money	Gate
1	350	₦1.85bn equity	60-day OEM trial; site counts
2	2,000	₦8–12bn BOI/club	Median ≥ 150 tx/day; bank cash SLA
3	5,000	Next ₦15–25bn	Four clean quarters at 2,000; DSCR ≥ 1.25×
4–5	10,000 → 20,000	Further tranches + retained profit	Two banks or bank + CIT; new cities still at ~180 tx/day

Hardware on the planning case is on the order of **₦3.85m × 20,000 ≈ ₦77bn**, spent over six years. Float at 20,000 is **~₦24bn** in the field — mostly **the bank's**. If Stage 1 or 2 misses, you stop. That is the correct outcome.

9. Financial Plan

Three unlevered cases share the same accounting (30% CIT + 3% education tax on PBT, five-year straight-line on machines and fit-out, 22% discount rate for cash-handling risk). They differ in traffic, fees, costs and how fast the fleet is pushed.

Assumption	Stress	Planning	Promoter (Grok “realistic”)
Year-end fleet Y1→Y6	200-1,200-2,500-5,000-8,000-12,000	350-2,000-5,000-10,000-15,000-20,000	500-2,000-5,000-10,000-16,000-20,000
Tx / up day	110	180	225
Uptime	85%	92%	93%
Blended fee	₦70	₦100	₦115
Gross / kiosk / month	₦199k	₦504k	₦732k
Bank share (from Y2)	38% of 70% of gross	32% of 55% of gross	30% of 50% of gross
Logistics	32% of gross	24%	22%
Site rent / month	₦120k	₦80k	₦70k
Unit CapEx (hw + fit-out)	₦4.95m	₦3.85m	₦3.30m
Theft / loss	3.5% of gross	1.2%	0.8%

Promoter is the conversation’s mid “realistic” band (roughly 200-250 tx/day and ₦80-150 fees, 2,000-then-20,000 scale). Planning is a feasibility haircut. Stress is what happens if sites are mediocre and small notes stay expensive.

Figure: Stress is value-destroying at every scale. Planning becomes profitable but not ₦12–24bn-at-2,000-machines profitable. Promoter is the only case that looks like the source deck.

9.1 Phase 1 sources and uses (planning)

Use	₦
350 × ₦3.85m machines and fit-out	1.35 billion
350 × ₦1.20m self-funded float	420 million
HQ, licences, legal, first insurance	80 million
Total opening equity	1.85 billion

Fund this with **equity** (promoter, angels, a small strategic). Do not open a BOI file for Phase 1. A development bank will ask for the data Phase 1 is meant to produce.

9.2 Unit economics and break-even

	Stress	Planning	Promoter
EBITDA break-even (tx/day, bank share on)	286	89	62
Assumed tx/day	110	180	225
Margin of safety	-160%	+51%	+72%

Planning has a real cushion — **if** 180 transactions happen. Stress has no cushion at all. Site selection is a binary risk, not a 10% sensitivity.

Planning revenue mix — multi-service kiosk

Figure: Planning mix used for narrative and bank-share design — about 45% note-breaking, 40% POS, 15% airtime/bills/ads. Change is the differentiator; POS is the volume engine.

9.3 Six-year unlevered P&L (planning — 20,000 path)

Year	Fleet (end)	Gross	EBITDA	NPAT	FCF	NPAT margin
Y1 2027	350	₦1.06bn	₦0.35bn	₦0.05bn	₦0.32bn	5.0%
Y2 2028	2,000	₦7.10bn	₦1.85bn	₦0.21bn	–₦5.02bn	3.0%
Y3 2029	5,000	₦21.16bn	₦5.88bn	₦1.38bn	–₦6.98bn	6.5%
Y4 2030	10,000	₦45.33bn	₦12.83bn	₦3.48bn	–₦8.97bn	7.7%
Y5 2031	15,000	₦75.56bn	₦21.64bn	₦6.85bn	–₦1.15bn	9.1%
Y6 2032	20,000	₦105.78bn	₦30.45bn	₦10.22bn	₦5.47bn	9.7%

Y2–Y5 free cash flow is negative because **machines are being bought faster than they earn**. That is why an unlevered 20,000 sprint has a **–₦11.6 billion** NPV at 22% even though Year 6 NPAT is ₦10bn. Scale is not the same as value.

9.4 The conversation's 2,000-machine table versus this model

Item	Source plan (May 2026, "realistic")	This study, planning,
Opening capital for 2,000	₦7.5–11.5bn (all at once)	₦1.85bn for 350, then ~₦6.4bn incremental in Y2
Annual gross at 2,000	₦17–43bn	~₦12.1bn run-rate (2,000 × ₦504k × 12)
Annual net	₦12–24bn (40–55% margin)	~₦1.2bn NPAT (Y3–Y6 hold)
Break-even on a batch	4–8 months per machine (stated)	Phase 1 IRR 11%; 2,000-hold IRR 21%

The gap is not a rounding error. The source table under-weights rent, CIT, bank share, depreciation and tax, and treats peak-site months as fleet averages. **Do not raise or lend against the ₦12–24bn figure.**

9.5 Hold cases — the scales that can be discussed with a lender

Path	6-year IRR	NPV @ 22%	What it means
Hold 350	11.1%	–₦448m	Proof engine. Does not clear a cash-handling hurdle. Still the correct first step.
Hold 2,000	21.2%	–₦89m	First scale that is near the hurdle. The real Phase 2 target.
Hold 5,000	19.1%	–₦571m	More machines, more growth capex; slightly worse than holding 2,000 unless fees beat plan.
Sprint 20,000 unlevered	n/m (–43%)	–₦11.6bn	Do not do this on equity alone.
Promoter sprint 20,000	84.5%	+₦18.2bn	Only if 225 tx/day and ₦115 fees are actually delivered fleet-wide.

Figure: Value appears when growth is paced or when cheap, right-sized debt funds a 2,000-kiosk hold. A ₦90bn facility on the 20,000 path inflates equity NPV only by stuffing the firm with cash it cannot service (see §10).

9.6 Promoter case (for the record)

If the fleet actually does 225 tx/day at ₦115 and costs stay at the conversation's leaner band, Year 6 NPAT is **₦39.3bn** on ₦158bn gross (25% net margin) and unlevered NPV is **+₦18.2bn**. That is a legitimate upside case. It is not the case a credit committee should underwrite, and it is still far below the conversation's ₦120–250bn net at 20,000 machines.

10. The ₦90 Billion Question

The last move in the source plan was: with proven traction, can we get ₦90 billion from a development bank, or is CBN backing enough?

10.1 Institutional answer

Institution	Role	₦90bn?
CBN	Regulator, possible sandbox/recognition, policy on denominations and IADs	No. Not a commercial lender to this company.
Bank of Industry	Most relevant DFI for manufacturing + digital infrastructure; large-enterprise window, single-digit-class rates, 7–10 year tenors	Possibly in tranches , after 300–500 live kiosks, audited numbers, bank cash agreements and collateral. ₦90bn as one private-ticket is high.
Development Bank of Nigeria	On-lends through PFIs to MSMEs	Unlikely as a ₦90bn direct
Commercial banks	Co-lenders, cash-supply partners, account relationship	Needed in any syndicate

The conversation's own probability band is retained as colour, not as a forecast: even with excellent traction, a 40–60% chance of **staged** ₦90bn-class money; much less with only a pilot.

10.2 What the debt can actually bear (planning economics)

Facilities are modelled at 9% interest, drawings as shown, amortisation from Year 3, leftover principal after Year 6 still on the books.

Facility	Against	Equity NPV @ 22%	Minimum DSCR	Year-6 debt left	Credit read
₦8bn in Y2	Hold at 2,000	+₦2.50bn	1.96×	₦4.0bn	Right-sized for Phase 2
₦25bn in Y2	Hold at 5,000	+₦7.35bn	0.82×	₦12.5bn	Too big — coverage breaks in Y2
₦15bn + ₦15bn	Hold at 5,000	+₦7.94bn	0.91×	₦15.0bn	Still tight
₦90bn (25+35+30)	Sprint to 20,000	+₦11.25bn	0.46×	₦47.1bn	Not bankable
₦90bn on promoter traffic	Sprint to 20,000	+₦42.4bn	1.06×	—	Barely 1× — still not a comfortable DFI credit

Figure: Only the ₦8 billion facility on a 2,000-kiosk hold clears a 1.25× comfort line on planning economics. ₦90 billion does not.

10.3 Recommended funding sequence (replaces the ₦90bn headline)

- Equity ₦1.85bn** — Phase 1, 350 kiosks.
- After 6–12 months of books** — BOI (or a bank club) **₦8–12 billion** to fund the step to 2,000, with machines as collateral and the cash-supply bank in the room.
- After four clean quarters at 2,000** — a second tranche (₦15–25bn class) only if unit traffic is at or above planning **and** DSCR stays $\geq 1.25\times$ on the combined debt.
- ₦90bn** — only as a **later syndicate** (BOI + commercial banks + possible DFI) once 5,000 kiosks exist, not as the first conversation.

This is the same sequence the source plan eventually recommended (“₦20–30 billion first, then scale”) — tightened, because ₦25bn already strains a 5,000-kiosk planning P&L.

10.4 ₦90 billion of what?

The limit on ₦90bn **profit** or a **₦90bn loan** is the **capacity of the model**: thin fees, one queue per pitch, rent, CIT and the bank’s cut. It is not a claim that Nigeria lacks 20,000 high-traffic areas.

If ₦90bn means...	On this strategy	When, if ever
A single loan / BOI cheque	No	Never as one ticket. ₦8–12bn after 350, then more tranches.
Yearly profit (NPAT)	Not on planning	~₦10bn at 20,000 good machines; ~₦1.2bn at a held 2,000. Promoter upside ~₦39bn. Grok’s ₦120–250bn net is not used.
Yearly revenue (gross fees)	Yes, if 20,000 busy sites are earned	Planning Y6 gross ~₦106bn. That is turnover, not money in the pocket.
Company value	Only much later	A hopeful multiple on ₦10bn profit can talk like ₦90bn. Not a plan.
At 2,000 machines (the real target)	No	~₦12bn gross and ~₦1.2bn profit. A real company. Not a ₦90bn company.

Nationwide deployment is how you **house** enough doors for ₦90bn+ sales. It does not mint ₦90bn of earnings.

11. Cost-Benefit of the Whole Plan

Costs are front-loaded (boxes and cash). Benefits show up at **2,000 good sites**, not from government or ATM-adjacent bank charity.

Stage	Cost (you / lenders)	Benefit if it works	Benefit if it fails
350 kiosks	₦1.85bn equity	Proof; ~₦0.5m gross / box / month; bank will talk; you own the assets	Capped loss of ₦1.85bn, not ₦90bn
→ 2,000	₦8-12bn facility + leftover equity	~ ₦1.2bn NPAT / year ; ₦8bn loan at ~ 2× DSCR	Bounded if you do not order 18,000 more
→ 5,000	Next ₦15-25bn	National core only if 180 tx/day still holds	₦25bn is already tight (DSCR ~0.8×) if traffic is only “okay”
→ 20,000	~ ₦77bn hardware over years + ~ ₦24bn cassette cash (mostly bank)	Option on ~₦106bn revenue / ~₦10bn NPAT	Unlevered sprint NPV ~– ₦12bn ; ₦90bn in one go does not pay

Who keeps the benefit: you (change fees + ~60–75% of POS; own the boxes); bank (~25–40% of POS and the float); host (rent ± 5–10%); CBN (no cheque).

Net: yes to 350 as a test; yes to 2,000 after data (**best risk-adjusted CBA**); no to buying 20,000 until 2,000 has paid and proved it.

11.1 How to maximize gain

- Location, not OEM volume.** 180 tx/day vs 110 is profit vs death. Kill the worst 10% of sites monthly.
- Bundle.** Change is the hook; POS and bills are the wallet.
- Own the box, rent the cash.** Negotiate 70%+ of POS. Do not lock ₦2.4bn of your notes at 2,000 units.
- Grow only when the last 50 boxes are above 150 tx/day.**
- Cut leaks:** uptime ≥ 92%, theft < 2%, ₦100–₦500 in the hopper, rent in the ₦50–80k band unless the count is exceptional.
- Cheap debt only when the box already prints** — ₦8–12bn on a 2,000 hold raises equity value; ₦90bn lowers it.

That beats 20,000 average sites and a ₦90bn story.

12. Risk Assessment

Risk	Likelihood	Impact	Mitigation
Weak sites (stress economics)	High if rushed	Fatal	Two-week counts; kill bottom decile monthly; cap Phase 1 at 350
Small-note scarcity	High	High	Bank SLA on mix; design around ₦100–₦500; recycle; never promise coins
Theft / vandalism	High	High	Caps, CIT, insurance with market-theft wording, 72-hour pull right
CBN reclassifies kiosk as ATM	Medium	High	Counsel opinion before OEM scale; IAD readiness file; no scheme-ATM claims in marketing
Acquirer or bank walks	Medium	High	Two acquirers by 500 kiosks; contract cash SLAs with penalties
FX on OEM batches	High	Medium	Quote in USD/RMB; hold 20% FX buffer; no 2,000-unit PO before Phase 1 data
POS giants copy the change module	Medium	Medium	Speed on leases and telemetry; exclusive site clauses where legal
Over-raising / over-ordering	High (given the ₦90bn story)	Fatal	Board resolution: no facility > 1.5× next-24-month capex; no 20k plan in the IM
Digital payments reduce cash-out	Medium (slow)	Medium	Bundle bills/airtime; do not build a 20-year cash-only thesis
Counterfeit intake	Medium	Medium	Validator grade; cassette quarantine; staff/CIT dual control

Overall: the model fails from **locations and cash logistics**, not from an inability to source a kiosk in Guangdong. The second-largest failure mode is **raising like a 20,000-kiosk utility before owning 350 working boxes**.

13. Environmental, Social & Governance

13.1 Environmental

- Solar-first kiosks cut diesel at the site; CIT vans are the larger footprint — route density in Lagos/Ogun first.
- End-of-life validators and batteries need an OEM take-back clause (e-waste).
- No claim is made that this is a green project for DFI “climate” windows; do not dress it as one.

13.2 Social

- Genuine inclusion story: small-note access in markets that banks underserve.
- Jobs: technicians, monitors, CIT escorts, HQ — material at 2,000 units, not at 10 prototypes.
- Site-host income (rent) is part of the licence to operate in markets.
- AML/CFT on POS and any cash-in must be real: thresholds, device geotag, watchlist screening via the acquirer.

13.3 Governance

- Single-purpose Ltd; reserved matters on debt above ₦2bn, OEM POs above 50 units, and any CBN/IAD classification change.
- Monthly kiosk P&L to the board; related-party CIT or site leases disclosed.

- External audit from Year 1 (BOI will require it anyway).
- Promoter machines are company assets — no informal “I own some, the company owns some.”

14. Conclusion & Recommendations

14.1 Feasibility verdict

The **progressed final plan is a feasible business model** and an **infeasible instant empire**.

Owning multi-service kiosks, placing them in cash-heavy non-bank sites, and using banks for float and small notes is consistent with how Nigerian agent cash already works. Phase 1 at **350 kiosks for ₦1.85 billion** is a rational proof. A hold at **2,000**, funded with a **right-sized (~₦8 billion)** development-bank or club facility after traction, is the first scale that can be discussed as a credit.

A **20,000-kiosk, ₦90 billion, CBN-backed national grid** is not feasible on the information in the source conversation, and it is not feasible on the planning case in this study. CBN backing is not a substitute for DSCR. The conversation’s **₦12–24 billion** net at 2,000 machines should not appear in any lender file.

14.2 Critical success factors

1. Site counts before leases.
2. 5–10 OEM units before 350.
3. Bank cash and small-note SLA before the 2,000-unit order.
4. Counsel on kiosk-versus-ATM before marketing “ATM replacement.”
5. Facility size tied to next-two-year capex and 1.25× DSCR, not to a ₦90bn story.
6. Monthly willingness to close bad sites.

14.3 Recommendations

#	Action	Owner	Timing
1	Incorporate, open the audit file, commission a written regulatory memo (kiosk vs ATM vs IAD)	Promoter + counsel	Month 0–1
2	Shortlist two China OEMs; order 10 units only	Promoter	Month 1–2
3	Two-week counts on 40 sites; sign ≤ 15 leases	Operations	Month 1–3
4	Acquirer term sheet (POS, geotag, settlement)	Promoter	Month 2
5	Run 10 units for 60 days; kill the OEM if validators fail Naira	Operations	Month 4–6
6	If medians ≥ 150 tx/day, raise/deploy the balance of 350 (₦1.85bn total uses)	Board	Month 6–12
7	Bank partnership process using live volumes (Appendix B)	Promoter	Month 9–15
8	BOI/club file for ₦8–12bn , 2,000-kiosk hold, machines as collateral — not ₦90bn	Finance	After 6–12 months of audited Phase 1
9	Revisit 5,000 and any ₦20–30bn second tranche only after four quarters at plan	Board	Year 3
10	Park Africa, textiles, cargo-airline, kiosk franchise, hotel-first rollout and “sell software to CBN” as separate memos	Promoter	Now

14.4 Final statement

CashEase is feasible as a **Nigerian multi-service cash-kiosk operator that owns its boxes and rents its float from banks**. You rent pitches like a shop — many doors in one busy belt, **one machine per pad** unless a count earns a second. It is not feasible as a CBN circulation franchise, a four-pack-per-station national grid, or a 20,000-unit / ₦90 billion raise on a conversation draft.

Build 350, measure, then borrow for 2,000. Nationwide hubs and any ₦90bn turnover story are earned after that. ₦90bn of **profit** or a **₦90bn cheque** is outside this model's capacity.

15. Appendices

A. Glossary

Term	Meaning in this study
Change / note-breaking	Accepting a larger Naira note and dispensing smaller notes (and coins if stocked)
CIT	Cash-in-transit
DSCR	Debt service coverage ratio — EBITDA / (interest + principal)
IAD	Independent ATM Deployer (CBN regime)
NIBSS	Nigeria Inter-Bank Settlement System
NPAT	Net profit after tax
PTSP	Payment Terminal Service Provider
Promoter case	Midpoint of the source conversation's "realistic" traffic and fee band
Planning case	Feasibility haircut used for go / no-go
Stress case	Weak sites, expensive float, high theft

B. Sample bank partnership proposal

Adapted from the progressed plan (May 2026). Replace brackets. Do not send until Phase 1 data exist.

To: Agency Banking / Digital Channels, [Bank]

From: CashEase Nigeria Ltd

Re: Agency partnership — cash provisioning and settlement for multi-service kiosks

Ask. A formal agency agreement under which the bank supplies mixed-denomination cash (including ₦50/₦100/₦200 as available) and NIBSS settlement for an initial **[300-500]** CashEase-owned kiosks in Lagos and Ogun, scaling to **2,000** within 18 months if SLAs hold.

What we own. All kiosks, site leases and brand. Ownership remains with CashEase on removal or expiry.

What we need from the bank. Cassette cash, denomination mix SLA, settlement, and a compliance channel. We deploy, maintain, insure and geotag.

Economics (opening ask). 60–75% of eligible POS/acquiring economics to CashEase; change fees to CashEase; site rent on us. Co-brand optional.

Why it helps the bank. Non-branch cash footprint, float turn, volume, and a contribution to density expectations without the bank buying the hardware.

Attachments (when live). 13-week kiosk P&L, uptime, fraud/theft, denomination shortages, machine specs, insurance binders, CAC/KYC, counsel memo on device classification.

C. BOI file outline (after Phase 1)

Use this only with **300-500 live kiosks** and an audit.

1. Sponsor, ownership, reserved matters
2. Regulatory memo and licences in force
3. Bank cash agreement (signed or near-final)
4. Fleet register and asset valuations (collateral)
5. 12-month audited/management accounts and kiosk cohort P&L
6. Use of proceeds: machines, fit-out, residual self-float — **no** 20,000-unit PO
7. Base, downside and covenant case (this model's planning / stress / hold-at-2,000)
8. DSCR, collateral cover, insurance
9. Jobs and inclusion metrics (sites in underserved markets)
10. Requested ticket: **₦8-12 billion**, 7-10 years, not ₦90 billion

D. Model files
